OVERVIEW

Journey to the solar system, where the eight planets of the solar system live, as we follow their daily lives, conflicts with each other, journeys and adventures in space.

We follow the adventures of the planets through Venus, our main character, who is full of empathy but struggles with self-confidence. The planets, who have never been outside the solar system, must journey to save Mercury, who fell in a blackhole. Venus leads the group across space and learns to overcome her lack of confidence.

The show is a mixture of curriculum and entertainment as we learn about space and at the same time develop values (e.g. kindness, anti-bullying).

Why this story?

We struggle with confidence, too!

Our biggest regrets as adults stem from lacking the self-confidence to charge through despite the outcome, from not trusting ourselves.

Our children are obsessed with space

And there's very little out there that teaches them about a place where they may go in the future in a fun, kinetic, and exciting way.

Learning is more than information

Children also need to develop value systems as they grow up, and we believe they can learn these values from an entertaining TV show.

Why now

We're undergoing a renaissance in space exploration. Projects such as the James Webb Space Telescope are exciting the curiosity and imaginations of both children and adults by uncovering previously unseen parts of the universe.

Exploration

show will include science exploration and value-based learning

Creating a sense of place

space has no visible landmarks, which poses a challenge when establishing a sense of place. To get around this, we are using different color palettes to represent different areas in the solar system. We are also including cosmic dust clouds, clouds of tiny particles, floating in space, which will temporarily condense into objects to create distinct backdrops.
